digitalSTROM P1 Energy Kit

Save money thanks to optimization of the self-consumption with your solar panels!

How it works:

Thanks to the connection to the P1 port, the dS-Energy system recognizes when there is overproduction of "green" energy.

The built-in smart home intelligence of digitalSTROM will automatically trigger consumption of the boiler, heat pump or EV charger in the dS system.

The consumers simply have to be connected to the 230V network via a dS device. Several consumers can be controlled simultaneously.

This simple installation increases the consumption of self-generated solar energy and saves the consumer money.

Configuration

P1 Energy Kit

dSS20 - Server

dSF20 - Filter

dSM20 - Meter

SW-UMR200 - Relais
